

Application for Senior Software Engineer, Cloud AI for Science

Dear Google Recruitment Team,

Why Me?

My current role is Forward Deployed Engineer at a client where I build agentic workflows in production, a similar class of problem your team faces in getting Co-Scientist and AlphaEvolve into the hands of research institutions. I've built a RAG agent that is used to review pitch documents prior to an investment meeting, saving an average of 2 hours per committee member. Separately, I reduced the company's token expenses by 10% by creating a dashboard that surfaces up to date model rates and deals for the LLMs available across our tools. I hold the Google Cloud Professional Machine Learning Engineer certification, with experience across Vertex AI, BigQuery, and Cloud Functions, but I'm also comfortable with other cloud providers and building cloud agnostic solutions with Kubernetes. I'm always eager to dive into fuzzy environments and gather requirements in order to deliver a system from design to production, and I've acted as a team lead and mentor to junior engineers.

Why Google?

Google Cloud AI's mission to accelerate real scientific discovery is a just cause and exactly the dynamic I want to build a career in. I'm especially excited by the challenge of designing modular systems that let research teams bring their own agents and UI components. I'm also drawn to collaborating with some of the sharpest engineers and researchers in the industry. I'd welcome the chance to discuss how I can contribute to launching the next generation of science agents on Google Cloud.

Sincerely,
Spas Zahariev
